Using Lightweight Text Analytics to Organise Academic Documents

Fictional sample paper for document-analysis testing

Abstract

This fictional study proposes a workflow to classify college documents, extract key fields, and create searchable summaries. All figures and claims are illustrative and intended only for software testing.

1. Introduction

Colleges manage certificates, activity reports, research papers, and meeting records. A document workflow can combine text extraction, metadata capture, classification, and human review.

2. Methodology

For this illustrative example, 120 synthetic documents were grouped into certificates, activity reports, research papers, and administrative records. A hypothetical classifier assigned labels using extracted text and titles.

3. Illustrative Results

Category	Sample count	Illustrative correct labels
Certificates	30	27
Activity reports	35	31
Research papers	25	22
Administrative records	30	26

These numbers are fabricated and must not be interpreted as empirical findings.

4. Conclusion

Document classification and metadata extraction can improve organisation when combined with validation and secure access controls.

FICTIONAL SAMPLE — ALL DATA ARE ILLUSTRATIVE.
